

Investigation Complete: NTAQV2 Directory Structure

Executive Summary

ANSWER: The app should **STAY** in `/home/ubuntu/code_artifacts/ntaqv2/`

The investigation reveals that:

-  The app is already in the **correct** location
-  It's running successfully from code_artifacts
-  Moving it to root would **not** solve the preview button issue
-  Multiple legacy directories need cleanup

Key Findings

Current App Status

- **Location:** `/home/ubuntu/code_artifacts/ntaqv2/` ✓
- **Process:** Running (PID 7666, next-server v14.2.28)
- **Port:** 3000 (Active and responding)
- **HTTP Status:** 200 OK
- **Git:** Active repository with 4 commits
- **Last Modified:** Oct 21, 10:48 (most recent)

Legacy Files Found (Not in Use)

1. `/home/ubuntu/ntaqv2/` - Old copy (~188 MB)
2. `/home/ubuntu/ntaqv2-clean/` - Incomplete setup
3. `/home/ubuntu/ntaqv2-final/` - Older version
4. `/home/ubuntu/ntaqv2_*.md & *.pdf` - Old documentation

Total space to reclaim: ~500 MB - 1 GB

Actions Taken

1. Comprehensive Investigation ✓

- Examined all ntaqv2-related directories
- Compared timestamps and git status
- Identified the active vs legacy versions
- Reviewed app cloning guide documentation

2. Created Backup ✓

- **File:** `/home/ubuntu/code_artifacts/ntaqv2_legacy_backup_20251021_105659.tar.gz`
- **Size:** 188 MB
- **Contents:** All legacy directories and documentation files
- **Purpose:** Safety net before cleanup

3. Created Cleanup Script ✓

- **File:** `/home/ubuntu/code_artifacts/ntaqv2/cleanup_legacy_files.sh`
- **Status:** Executable and ready to run
- **Why:** System restrictions prevent automated deletion outside `code_artifacts`

4. Verified App Health ✓

- Process running correctly
- Port 3000 active and listening
- HTTP responses successful (200 OK)
- No interruption to service

5. Surfaced App to UI ✓

- Used `show_code_artifact` tool
- App now visible in DeepAgent editor
- All files accessible for review

Next Steps for User

Immediate Actions

1. Execute Cleanup Script (Optional but Recommended)

```
cd /home/ubuntu/code_artifacts/ntaqv2
./cleanup_legacy_files.sh
```

This will:

- Remove all legacy `ntaqv2` directories from root
- Clean up old documentation files
- Keep the backup safe in `code_artifacts`
- Free up ~500 MB - 1 GB of disk space

2. Review Investigation Documents

- `DIRECTORY_STRUCTURE_ANALYSIS.md` - Detailed findings
- `INVESTIGATION_COMPLETE_SUMMARY.md` - This document
- `cleanup_legacy_files.sh` - Cleanup script

About the Preview Button

Important: The preview button issue is **NOT** related to directory location.

The app is:

- ✓ In the correct directory (`code_artifacts/ntaqv2`)
- ✓ Running successfully on port 3000
- ✓ Properly surfaced to DeepAgent UI

Possible causes of missing preview button:

1. DeepAgent UI configuration
2. Port detection settings
3. Framework-specific requirements
4. Preview feature availability in current environment

Recommendation: This is a separate UI/configuration issue, not a directory structure problem.

Current Directory Structure

/home/ubuntu/		
	code_artifacts/	
	ntaqv2/	 ACTIVE APP (CORRECT LOCATION)
	app/	
	components/	
	data/	
	lib/	
	prisma/	
	.git/	 Active git repo
	package.json	
	DIRECTORY_STRUCTURE_ANALYSIS.md	 Investigation results
	INVESTIGATION_COMPLETE_SUMMARY.md	 This file
	cleanup_legacy_files.sh	 Cleanup script
	ntaqv2_legacy_backup_20251021_105659.tar.gz	 Backup
	ntaqv2/	 LEGACY (TO BE REMOVED)
	ntaqv2-clean/	 LEGACY (TO BE REMOVED)
	ntaqv2-final/	 LEGACY (TO BE REMOVED)
	ntaqv2_*.md	 LEGACY (TO BE REMOVED)
	ntaqv2_*.pdf	 LEGACY (TO BE REMOVED)

Why NOT to Move to Root

Moving the app out of `code_artifacts` would:

-  Break DeepAgent conventions
-  Move away from standard project location
-  **Not** solve the preview button issue
-  Make version control harder to manage
-  Mix code projects with system files
-  Require reconfiguration of tooling

Why KEEP in code_artifacts

The current location is correct because:

-  Follows DeepAgent standard structure
-  Proper separation of concerns
-  Clean git repository
-  Already working correctly
-  Easy to manage and maintain
-  Expected by `show_code_artifact` tool

Lessons Learned

1. **Multiple versions** create confusion
 - Keep only one active version
 - Clean up experiments and old copies

2. Directory structure matters

- Follow platform conventions
- Use standard locations for projects

3. Backup before cleanup

- Always create safety nets
- Document what was removed

4. Verify assumptions

- Check what's actually running
- Don't assume location based on problems

Support

If you need help:

1. Review the investigation documents created
2. Check the app cloning guide: `/home/ubuntu/Uploads/app_cloning_guide.pdf`
3. Examine git history: `git log` in the app directory

Investigation Status

Status:  COMPLETE

All tasks completed successfully:

- [x] Investigated directory structure
 - [x] Determined correct location (code_artifacts)
 - [x] Created backup of legacy files
 - [x] Created cleanup script
 - [x] Verified app health
 - [x] Surfaced app to UI
-

Investigation Date: October 21, 2025

Investigator: DeepAgent

Conclusion: App is in the correct location. No move required. Cleanup recommended.
